

1. What is CSS and why is it used.

CSS stands for Cascading Style Sheet. To design your webpage layout and style, CSS is helping for making a webpage looking good and user friendly design.

CSS is used for:

- * To make a websites attractive.
- * To Control layout.
- * To make responsive design
- * To separate design from content.

2. What are the three types of CSS?

CSS has 3 types.

- i) Inline
- ii) Internal
- iii) External

3. What is the difference between inline CSS, internal CSS, External CSS?

inline CSS :-

Inline CSS is written inside an HTML tag using the style attributes. Not recommended large page.

- * Applied to a single element only
- * Highest Priority.

Internal CSS:-

- * Applied to one webpage only.
- * Can style multiple elements is that Page.
- * useful for small Projects.

External CSS:-

- * Can be used across multiple Pages.
- * Clean and maintainable.
- * Most commonly used in real projects.

4. which CSS types has highest priority?

CSS is priority depend on the Cascad

rules.

Inline CSS has the highest priority among the three main types of CSS. Inline style defined directly on an element using the style attributes

5. which CSS methods is mostly used in real time projects?

In real time Professional Projects, External CSS is the most widely used method for applying styles. While there are three primary ways to add CSS real-world applications favor External CSS for its scalability and performance.

b. ^{used} CSS selectors are patterns to find and select specific HTML elements on a webpage so you can apply styles to them. They act as the "address" or target in a CSS rule, telling the browser which parts of your content should be changed.

Types of selectors.

(*) Universal selector, class selector (.), id selector (#), Element selector (tags), group selector, child selector, Descendant selector, Attribute selector.

7. What is the difference between class selector and id selector?

class selector (.)

Reusable for multiple elements

Start with a dot, like

Example

Lower

Repeated styles (buttons, list items)

Id selector (#)

unique to one single element.

Starts with a hash line (# example)

Higher

unique layout parts (header, footer)

8. What is the Purpose of -

Universal Selector in CSS (*) is used to target and style every element on a web page simultaneously. Global resets, Box model standardization, Typography defaults, Scoped selection, Debugging. Low Specificity, name space support, Performance.

9. What is cascading?

multiple types can apply to same element. and browser decide which style should win. * importance and origin * specificity * source order.

10. What is specificity in CSS?

specificity is the priority calculation system. used by browser with determine which CSS rule. Should apply when multiple styles or rules target at the same elements.

11. What is the difference between block and inline elements?

In web development, block and inline define how elements are visually structured on a webpage. Block elements always start with a new line. Inline elements not start with a new line. Block element take the full width and inline elements take the exact the element width.

12. What is Flexbox and why is it used?

Flexbox is a CSS layout model used to arrange elements in rows or columns efficiently. It helps developers create responsive and aligned layouts without relying on floats or complicated positioning. Flex box is mainly used.

- * Align items easily
- * Create responsive layouts
- * Control spacing between elements
- * Reorder items visually
- * Make Containers adapt to different screen sizes.

13. What is the difference between justify-content and align-items?

In CSS Flexbox and Grid.
justify-content and ~~justify~~ align-items control the layout of element inside a container.
The primary difference is the axis they target.
justify-content

This property manages how items are spaced and distributed along the main axis. It affects how empty space is handled within the container.
align-items

This property manages how items are positioned along the cross axis. It controls the height or vertical placement of the items inside the container.

14. What is difference between px, em, rem, and Percentage units?

These CSS units primarily in how they scale. px is fixed, while em, rem and % are relative. They are used for sizing, layout, and typography in web development.

Px (Pixels): An absolute unit that measures exact screen pixels. It does not scale with the device or user font setting.

em :- A relative Unit based on the Parent elements font size. If nested heavily, compounding issues can occur where size multiply upon themselves.

rem :- A relative unit based entirely on the root elements font size.

Percentage :- Always relative to another value, usually determined by the context in which it is used.

15. What is the difference between RGB, RGBA, and HEX color values in CSS?

RGB	RGBA	HEX
standard color mixing	transparency/opacity	quick, short notation
Decimal (0-255)	Decimal + Alpha (0-1)	Hexadecimal (00-FF)
High easy to weak	High: clear transparency	Low: compact but cryptic
